Mini Project 1

By: Makenzie Johnson

What is the question?

- What are the most common words used in classic literature?

Writing is a form of art that draws the reader into the story. Choosing the right words determines the success of one's work. How influential is this work? What context can we grab from this? What can we learn about the era this story was written from?

What was the approach?

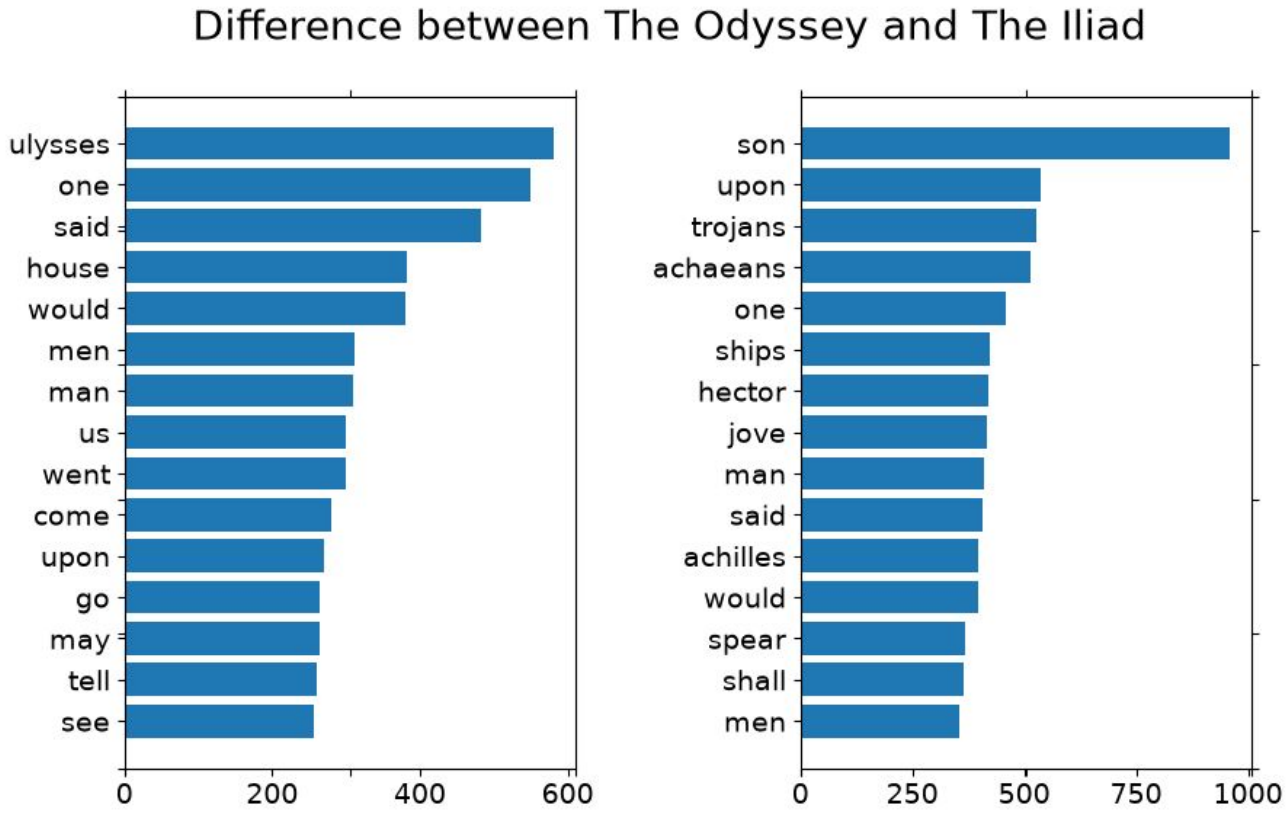

I decided to compare *The Iliad* and *The Odyssey* by Homer. Then, compare *Undine* by Freiherr de Friedrich Heinrich Karl La Motte-Fouqué and *The Romance of Tristan and Iseult* by Joseph Bédier.

To compare word frequencies, I would grab the two text I will use to compare. Next, I take out punctuations, special characters, quotes, and anything else that wouldn't count as a word. Afterwords, create dictionaries for both text, so when I split the strings into arrays, I can populate them where each word would be in its own index. After sorting the dictionaries, I will plot the results.

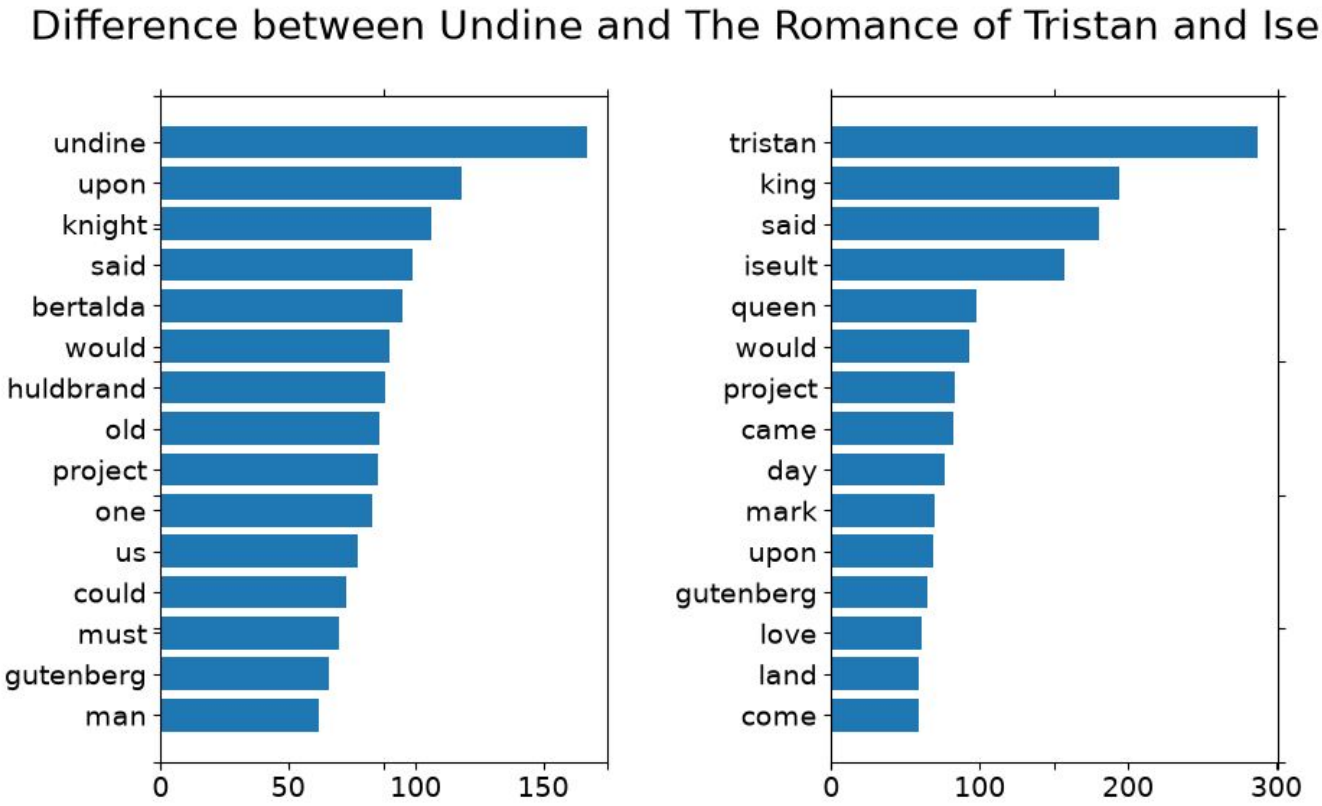

What problems did I encounter?

When using the premade code, I didn't have all of the libraries pip installed. Also, some functions didn't match with the version of python I had, so I had to look up alternatives.

What results did I get? Pt. 1

What results did I get? Pt. 2

What new ideas did this generate?

- The most used words matches with the plot of the story. You can somewhat tell what the story is about.
- Vocabulary didn't change much over the years.
- When comparing Homer's books, I assumed that there would be a few words he would've commonly use across books that shows separation from other authors (his writing style). I was mistaken, but it would make sense because a string of words would better capture his writing style instead of individual words.
